## Mono class D audio power amplifier with dedicated analog switch

## Features

－Wide operating voltage range from $\mathrm{V}_{\mathrm{CC}}=2.4 \mathrm{~V}$ to 4.3 V
■ Audio amplifier standby mode active low
■ Output power：1．6 W at 4．2 V or 0．75 W at 3．0 V into $4 \Omega$ with $1 \%$ THD＋N maximum
■ Output power： 0.95 W at 4.2 V or 0.45 W at 3.0 V into $8 \Omega$ with $1 \%$ THD＋N maximum
－Adjustable gain via external resistors
－Low current consumption 2 mA at 3 V
－Efficiency：88\％typical
■ Signal－to－noise ratio： 85 dB typical
■ PSRR： 63 dB typical at 217 Hz with 6 dB gain
■ PWM base frequency： 250 kHz
－Low pop and click noise
－Dual Power SPST with separated sonircl
■ Ultra－high off－isolation on ana＇o r switen： -80 dB typical from $20 \mathrm{~Hz} \approx っ$ ？ kHz

## Applications

－Cellular te＇erinos
－PDAs
－ivniこちook PCs

## Description

The TS4961T is a smart combination of one mono class D audio power amplifier and a high－speed CMOS low－voltage dual power analog SPST．

One of the key functions of this device is the switch mode of the various audio signals coming from the codec or baseband through the loudspeaker．It can drive up to 1.6 W into a $4 \Omega$ load and 0.95 W into an $8 \Omega$ load．It achieves an outstanding efficiency of up to $88 \%$ typical．

The audio amplifying gain of the device can be controlled via two external gain－setting resistors．It is designed to operate from 2.4 to 4.3 V ，making this device ideal for portable applications．

## 1

Absolute maximum ratings and operating conditions

Table 1. Absolute maximum ratings

| Symbol | Parameter | Value | Unit |
| :---: | :---: | :---: | :---: |
| $\mathrm{V}_{\text {CCA }}$ \& $\mathrm{V}_{\text {CCS }}$ | Supply voltage ${ }^{(1)(2)}$ | GND to 5.5 | V |
| $V_{\text {in }}$ | Input voltage | GND-0.3V / $\mathrm{V}_{\mathrm{CC}}+0.3 \mathrm{~V}$ | V |
| $\mathrm{T}_{\text {oper }}$ | Operating free-air temperature range | -40 to +85 | ${ }^{\circ} \mathrm{C}$ |
| $\mathrm{T}_{\text {stg }}$ | Storage temperature | -65 to +150 | ${ }^{\circ} \mathrm{C}$ |
| $\mathrm{T}_{\mathrm{j}}$ | Maximum junction temperature | 150 | $\bigcirc$ |
| $\mathrm{R}_{\text {thja }}$ | Thermal resistance junction to ambient ${ }^{(3)}$ | 39 | CiN |
| $\mathrm{R}_{\text {thjc }}$ | Thermal resistance junction to case | 5 | C/W |
| $\mathrm{P}_{\mathrm{d}}$ | Power dissipation | Internally limi $\mathbf{e c}^{\prime}$, $(1)$ |  |
| ESD | Human body model ${ }^{(5)}$ | < 2 | kV |
|  | Machine model ${ }^{(6)}$ | 200200100200 | V |
| Latch-up | Latch-up immunity of the Class D Amplifier (All Pins) Latch-up immunity of the Analog Switch (Supply Pins) Latch-up immunity of the Analog Switch Supply (I/C, D.ns) |  | mA |
| $V_{\text {STBY }}$ | Standby pin voltage maximum voltage | GND-0.3V / $\mathrm{V}_{\mathrm{CC}}+0.3 \mathrm{~V}$ | V |
|  | Lead temperature (soldering, 10 sec ) | 260 | ${ }^{\circ} \mathrm{C}$ |

1. Caution: this device is not protected in the ever.ı of a bnormal operating conditions, such as short-circuiting between any one output pin and ground, between any ant ourp't pin and $V_{C C}$, and between individual output pins.
2. All voltage values are measured with $r \in s p e c+$ to the ground pin.
3. When mounted on a 4-layers PC?
4. Exceeding the power derati ig $\sim^{2}$.es during a long period provokes abnormal operating conditions.
5. Human body modei a 0 pl capacitor is charged to the specified voltage, then discharged through a $1.5 \mathrm{k} \Omega$ resistor between two pins of $i$ ie device. This is done for all couples of connected pin combinations while the other pins are floating.
6. Machine mc a 200 pF capacitor is charged to the specified voltage, then discharged directly between two pins of the device wit.l $n c$ external series resistor (internal resistor $<5 \Omega$ ). This is done for all couples of connected pin combinations while to 0 oth $\operatorname{rr}$ pins are floating.

Tal!é. Operating conditions for audio amplifier section

| Symbol | Parameter | Value | Unit |
| :---: | :--- | :---: | :---: |
| $\mathrm{V}_{\mathrm{CCA}}$ | Supply voltage $^{(1)}$ | 2.4 to 4.3 | V |
| $\mathrm{~V}_{\text {IC }}$ | Common mode input voltage range $^{(2)}$ | 0.5 to $\mathrm{V}_{\mathrm{CC}}-0.8$ | V |
| $\mathrm{~V}_{\text {STBY }}$ | Standby voltage input: <br> Class D amplifier ON <br> Class D amplifier OFF |  |  |
| $\mathrm{R}_{\mathrm{L}}$ | Load resistor | $1.4 \leq \mathrm{V}_{\text {STBY }} \leq \mathrm{V}_{\mathrm{CC}}$ <br> $\mathrm{GND} \leq \mathrm{V}_{\mathrm{STBY}} \leq 0.4$ | V |

1. For $\mathrm{V}_{\mathrm{CC}}$ from 2.4 V to 2.5 V , the operating temperature range is reduced to $0^{\circ} \mathrm{C} \leq \mathrm{T}_{\mathrm{amb}} \leq 70^{\circ} \mathrm{C}$.
2. For $\mathrm{V}_{\mathrm{CC}}$ from 2.4 V to 2.5 V , the common mode input range must be set at $\mathrm{V}_{\mathrm{CC}} / 2$.
3. Without any signal on $V_{\text {STBY }}$, the device is in standby.
4. Minimum current consumption is obtained when $\mathrm{V}_{\mathrm{STBY}}=\mathrm{GND}$.

Table 3. Operating conditions for analog switch section

| Symbol | Parameter | Value | Unit |
| :---: | :--- | :---: | :---: |
| $\mathrm{V}_{\mathrm{CC}}$ | Supply voltage | 2.4 to 4.3 | V |
| $\mathrm{~V}_{\text {in }}$ | Input voltage | 0 to $\mathrm{V}_{\mathrm{CC}}$ | V |
| $\mathrm{V}_{\text {IC }}$ | Control input voltage | 0 to 4.3 | V |
| $\mathrm{~V}_{\mathrm{O}}$ | Output voltage | 0 to $\mathrm{V}_{\mathrm{CC}}$ | V |
| $\mathrm{dt} / \mathrm{dv}$ | Input rise and fall time control input | $\mathrm{V}_{\mathrm{CC}}=2.5 \mathrm{~V}$ | 0 to 20 |
|  |  | $\mathrm{~V}_{\mathrm{CC}}=3.0 \mathrm{~V}$ to 4.3 V | 0 to 10 |
| nyy | $\mathrm{ns} / \mathrm{V}$ |  |  |

Table 4. Audio amplifier standby mode settings

| /STDBY | Functional description |
| :---: | :---: |
| Low | OFF |
| High | Device is in shut-down mode |
| Device is in operating। ode |  |

Table 5. Analog switch settings truth table

| SLn | Switch $N^{\circ} 1$ | Switch $N^{\circ}$ 2 |
| :---: | :---: | :---: |
| High | ON | ON |
| Low | D1 is connected tr T1 | D2 is connected to T2 |
| OFF |  |  |
| High impeciance from D1 to T1 | OFF |  |

Table 6. Pin description

| Name | Pin number | Function |
| :---: | :---: | :---: |
| VCCA | 6 | Class D audio amplifier power supply voltage input pin |
| VCCS | 2 | Analog switch power supply voltage input pin |
| /STDBY | 12 | Standby input pin (active low) to disable the audio amplifier |
| T1 | 1 | Independent output audio channel 1 |
| D2 | 3 | Common input audio channel 2 |
| SL2 | 4 | Select input pin for D2 to T2 (active high) |
| OUT+ | 5 | Positive differential audio output |
| GNDA | 7 | Audio amplifier input ground |
| OUT- | 8 | Negative differential audio output |
| T2 | 9 | Independent output audio channel 2 |
| GNDS | 10 | Analog switch input ground |
| SL1 | 11 | Select input pin for D1 to T1 (active ingh) |
| D1 | 13 | Common input audio chanr.al: |
| NC | 14 | No internal connection |
| IN- | 15 | Audio negative (iffrcuitial input |
| $\mathrm{IN}+$ | 16 | Audio p ssitio e むifferential input |
| E-Pad | - | Exposed pad (should be connected to GND) |

## 2 Electrical characteristics

### 2.1 Audio amplifier section

Table 7. Electrical characteristics at $\mathrm{V}_{\mathrm{Cc}}=+4.3 \mathrm{~V}$ with $\mathrm{GND}=0 \mathrm{~V}, \mathrm{~V}_{\mathrm{icm}}=2.1 \mathrm{~V}$ and $\mathrm{T}_{\mathrm{amb}}=25^{\circ} \mathrm{C}$ (unless otherwise specified) ${ }^{(1)}$

## 3 Electrical characteristics curves

### 3.1 Audio amplifier section

The graphs included in this section use the following abbreviations:

- $\mathrm{R}_{\mathrm{L}}+15 \mu \mathrm{H}$ or $30 \mu \mathrm{H}=$ pure resistor + very low series resistance inductor.
- Filter $=$ LC output filter $(1 \mu \mathrm{~F}+30 \mu \mathrm{H}$ for $4 \Omega$ and $0.5 \mu \mathrm{~F}+60 \mu \mathrm{H}$ for $8 \Omega)$.
- All measurements done with $\mathrm{C}_{\mathrm{s} 1}=1 \mu \mathrm{~F}$ and $\mathrm{C}_{\mathrm{s} 2}=100 \mathrm{nF}$ except for PSRR where $\mathrm{C}_{\mathrm{s} 1}$ is removed.

### 3.2 Analog switch section

The graphs included in this section use the following abbreviations.

- $R_{L}+15 \mu \mathrm{H}$ or $30 \mu \mathrm{H}=$ pure resistor + very low series resistance inductor.
- Filter $=$ LC output filter $(1 \mu \mathrm{~F}+30 \mu \mathrm{H}$ for $4 \Omega$ and $0.5 \mu \mathrm{~F}+60 \mu \mathrm{H}$ for $8 \Omega)$.
- All measurements done with $\mathrm{C}_{\mathrm{s} 1}=1 \mu \mathrm{~F}$ and $\mathrm{C}_{\mathrm{s} 2}=100 \mathrm{nF}$ except for PSRR where $\mathrm{C}_{\mathrm{s} 1}$ is removed.

## 4 Application component information

Table 15. Component information

| Component | Functional description |
| :---: | :---: |
| $\mathrm{C}_{\text {SA }}$ | Bypass supply capacitor. Install as close as possible to the VCCA pin of the TS4961T to minimize high-frequency ripple. A 1 uF ceramic capacitor should be added to enhance power supply filtering at high frequencies (see below). |
| $\mathrm{C}_{\text {SS }}$ | Bypass supply capacitor. Install as close as possible to the VCCS pin of the TS4961T to minimize high-frequency ripple. A 100 nF ceramic capacitor should be added to enhance power supply filtering at high frequencies. |
| $\mathrm{R}_{\text {IN }}$ | Input resistor to program the TS4961T differential gain (gain $=300 \mathrm{k} \Omega / \mathrm{R}_{\text {IN }}$ with $R_{I N}$ in $k \Omega$ ). |
| $\mathrm{C}_{\text {IN }}$ | Because common mode feedback is implemented, these input cane citors are optional. However, they can be added to form with $\mathrm{R}_{\text {IN }}$ a 1 si , $\mathrm{N}_{\mathrm{N}}$ er high pass filter with a -3 dB cut-off frequency $=1 /\left(2^{\star} \pi^{*} \mathrm{R}_{\mathrm{IN}}{ }^{*} \mathrm{C}_{\mathrm{IN}}\right)$. |

Figure 75. Typical application schematics

### 4.1 Common mode feedback loop limitations

The common mode feedback loop allows the output DC bias voltage to be averaged at $\mathrm{V}_{\mathrm{CC}} / 2$ for any DC common mode bias input voltage.

However, because of the $\mathrm{V}_{\mathrm{icm}}$ limitation in the input stage (see Table 2: Operating conditions for audio amplifier section on page 3), the common mode feedback loop can only fulfill its role within a defined range. This range depends upon the values of $V_{C C}$ and $R_{\text {in }}(A v)$. To obtain a good estimation of the $\mathrm{V}_{\mathrm{icm}}$ value, the following formula can be used (no tolerance on $\mathrm{R}_{\text {in }}$ ):

$$
\begin{equation*}
\mathrm{V}_{\mathrm{icm}}=\frac{\mathrm{V}_{\mathrm{CC}} \times \mathrm{R}_{\mathrm{in}}+2 \times \mathrm{V}_{\mathrm{IC}} \times 150 \mathrm{k} \Omega}{2 \times\left(\mathrm{R}_{\mathrm{in}}+150 \mathrm{k} \Omega\right)} \tag{V}
\end{equation*}
$$

with

$$
\begin{equation*}
V_{I C}=\frac{\ln ^{+}+\operatorname{In}^{-}}{2} \tag{V}
\end{equation*}
$$

and the result of the calculation must be in the range:

$$
0.5 \mathrm{~V} \leq \mathrm{V}_{\mathrm{icm}} \leq \mathrm{V}_{\mathrm{C}}-1.8 \mathrm{~V}
$$

Due to the $+/-9 \%$ tolerance on the $150 \mathrm{k} \Omega$ resistor 1.に also important to check $\mathrm{V}_{\mathrm{icm}}$ in these conditions:

$$
\frac{\mathrm{V}_{\mathrm{CC}} \times \mathrm{R}_{\mathrm{in}}+2 \times \mathrm{V}_{\mathrm{IC}} \times 153.5 \kappa \Omega}{2 \times\left(\mathrm{R}_{\mathrm{in}}+136.5 \mathrm{nsL}\right)} \leq \mathrm{V}_{\mathrm{icm}} \leq \frac{\mathrm{V}_{\mathrm{CC}} \times \mathrm{R}_{\mathrm{in}}+2 \times \mathrm{V}_{\mathrm{IC}} \times 163.5 \mathrm{k} \Omega}{2 \times\left(\mathrm{R}_{\mathrm{in}}+163.5 \mathrm{k} \Omega\right)}
$$

If the result of the $\mathrm{V}_{\mathrm{icm}}$ carcuidion is not in the previous range, input coupling capacitors must be used (with $\mathrm{V}_{\text {(; }}$ 1:0in 2.4 V to 2.5 V , input coupling capacitors are mandatory).

## For example:

With $\bigvee^{\prime} c r=3{ }^{\circ}, R_{\text {in }}=150 \mathrm{k} \Omega$ and $\mathrm{V}_{\mathrm{IC}}=2.5 \mathrm{~V}$, we typically find $\mathrm{V}_{\mathrm{icm}}=2 \mathrm{~V}$ and this is lower than $3 \mathrm{r}^{\prime}-0.8 \mathrm{~V}=2.2 \mathrm{~V}$. With $136.5 \mathrm{k} \Omega$ we find 1.97 V , and with $163.5 \mathrm{k} \Omega$ we have 2.02 V . Tr sinfore, no input coupling capacitors are required.

### 4.2 Low frequency response

If a low frequency bandwidth limitation is required, it is possible to use input coupling capacitors.
In the low frequency region, $\mathrm{C}_{\text {in }}$ (input coupling capacitor) starts to have an effect. $\mathrm{C}_{\text {in }}$ forms, with $R_{\text {in }}$, a first order high-pass filter with a -3 dB cut-off frequency:

$$
\begin{equation*}
F_{C L}=\frac{1}{2 \pi \times R_{\text {in }} \times C_{\text {in }}} \tag{Hz}
\end{equation*}
$$

Therefore, for a desired cut-off frequency $\mathrm{F}_{\mathrm{CL}}, \mathrm{C}_{\text {in }}$ is calculated as follows:

$$
\begin{equation*}
C_{i n}=\frac{1}{2 \pi \times R_{i n} \times F_{C L}} \tag{F}
\end{equation*}
$$

with $\mathrm{R}_{\text {in }}$ in $\Omega$ and $\mathrm{F}_{\mathrm{CL}}$ in Hz .

### 4.3 Decoupling of the circuit

A power supply capacitor, referred to as $\mathrm{C}_{\mathrm{S}}$, is necessary $\pm$ n ccrectly bypass the class D part of the TS4961T.

The TS4961T has a typical switching frequency at $\iota^{\imath} \downarrow こ \mathrm{kHz}$ and an output fall and rise time at approximately 5 ns . Because of these ver) tast :ransients, careful decoupling is mandatory.
A $1 \mu \mathrm{~F}$ ceramic capacitor is enough, but it must be located very close to the TS4961T in order to avoid any extra parasitic inductance created by a long track wire. In relation with $\mathrm{dl} / \mathrm{dt}$, this parasitic inducté $\mathrm{n} \odot{ }^{\circ}$ in roduces an overvoltage that decreases the global efficiency and, if it is ton hish, may cause a breakdown of the device.
In addition, even if a ceramic capacitor has an adequate high frequency ESR value, its current capab:li, y is also important. A 0603 size is a good compromise, particularly when a $4 \Omega$ loaí 's uiod.

Annther important parameter is the rated voltage of the capacitor. A $1 \mu \mathrm{~F} / 6.3 \mathrm{~V}$ capacitor is.d at 5 V , loses about $50 \%$ of its value. In fact, with a 5 V power supply voltage, the recoupling value is about $0.5 \mu \mathrm{~F}$ instead of $1 \mu \mathrm{~F}$. Since $\mathrm{C}_{S}$ has a particular influence on the THD $+N$ in the medium-high frequency region, this capacitor variation becomes decisive. In addition, less decoupling means higher overshoots, which can be problematic if they reach the power supply AMR value ( 6 V ).

### 4.4 Wake-up time ( $\mathrm{t}_{\mathrm{wu}}$ )

There is a wait of approximately 5 ms when standby is released to set the device ON. The TS4961T has an internal digital delay that mutes the outputs and releases them after this time in order to avoid any pop noise.

### 4.5 Shutdown time ( $\mathbf{t}_{\text {StBy }}$ )

When the standby command is set, the time required to put the two output stages into high impedance and to put the internal circuitry in standby mode, is about 5 ms . This time is used to decrease the gain and avoid any pop noise during shutdown.

### 4.6 Consumption in standby mode

Between the shutdown pin and GND there is an internal $300 \mathrm{k} \Omega$ resistor. This resistor forces the TS4961T to switch to standby mode when the standby input is left floating.

However, this resistor also introduces additional power consumption if the standby pin voltage is not 0 V .

### 4.7 Single-ended input configuration

 capacitors are necessary. Figure 76 shows a typical single-e idf a invut application.

Figure 76. Typical single-ended input application

All formulas are identical except for the gain (with $\mathrm{R}_{\text {in }}$ in $\mathrm{k} \Omega$ ):

$$
\mathrm{A}_{\mathrm{V}_{\text {single }}}=\frac{\mathrm{V}_{\mathrm{e}}}{\mathrm{Out}^{+}-\mathrm{Out}^{-}}=\frac{300}{\mathrm{R}_{\text {in }}}
$$

Due to the internal resistor tolerance, $A_{\text {Vsingle }}$ is in the range of:

$$
\frac{273}{R_{\text {in }}} \leq A_{V_{\text {single }}} \leq \frac{327}{R_{\text {in }}}
$$

In the event that multiple single-ended inputs are summed, it is important that the impedance on both TS4961 inputs ( $\mathrm{In}^{-}$and $\mathrm{In}^{+}$) be equal.

Figure 77. Typical application schematics with multiple single-ended inputs

We have the following equations.

$$
\begin{align*}
\text { Out }^{+}-\text {Out }^{-} & =V_{e 1} \times \frac{300}{R_{i n 1}}++V_{e k} \\
C_{\mathrm{eq}} & =\sum_{\mathrm{j}=1}^{K} \mathrm{C}_{\mathrm{inj}}  \tag{F}\\
C_{\mathrm{inj}} & =\frac{1}{2 \times \pi \times R_{\mathrm{inj}} \times F_{C L j}} \\
R_{\mathrm{eq}} & =\frac{1}{\sum_{\mathrm{j}=1}^{k} \frac{1}{R_{\mathrm{inj}}}}
\end{align*}
$$

In general, for mixed situations (single-ended and differential inputs), the same rule must be used, that is, to equalize impedance on both TS4961T inputs.

### 4.8 Output filter considerations

The TS4961T is designed to operate without an output filter. However, due to very sharp transients on the TS4961T output, EMI radiated emissions may cause some standard compliance issues.

These EMI standard compliance issues can appear if the distance between the TS4961T outputs and loudspeaker terminal are long (typically more than 50 mm , or 100 mm in both directions, to the speaker terminals). Since the PCB layout and internal equipment device are different for each configuration, it is difficult to provide a one-size-fits-all solution.

However, to decrease the probability of EMI issues, there are several simple rules to follow.

- Reduce, as much as possible, the distance between the TS4961T output pins and the speaker terminals.
- Use ground planes for shielding sensitive wires.
- Place, as close as possible to the TS4961T and in series with each outr,ut, $\exists$ ?rrite bead with a rated current of 2.5 A minimum, and impedance great?r thai: $\mathcal{\prime} 0 \Omega$ at frequencies above 30 MHz . If, after testing, these ferrite beads ar $\geqslant \mathrm{r}$ คi necessary, replace them by a short circuit.
- Allow enough footprint to place, if necessary, a capacitor 'o short perturbations to ground as shown in Figure 78.

Figure 78. Output filter for shorting pertubatinis io ground

In the case where $+\boldsymbol{r}$ distance between the TS4961T outputs and speaker terminals is high, it is possible to have low frequency EMI issues due to the fact that the typical operating freque 7 」 に 250 kHz .

In tr.1s configuration, it is recommended to use an output filter. It should be placed as close a: possible to the TS4961T.

### 4.9 Examples with summed inputs

### 4.9.1 Example 1: dual differential inputs

Figure 79. Typical application schematics with dual differential inputs

With ( $R i$ in $k \Omega$ ):

$$
\begin{gathered}
A_{V_{1}}=\frac{\text { Out }^{+}-\text {Out }^{-}}{E_{1}^{+}-E_{1}^{-}}=\frac{300}{R_{1}} \\
A_{V_{2}}=\frac{\text { Out }^{+}-\text {Out }^{-}}{E_{2}^{+}-E_{2}^{-}}=\frac{300}{R_{2}} \\
0.5 \mathrm{~V} \leq \frac{V_{C C} \times R_{1} \times R_{2}+300 \times\left(V_{I C 1} \times R_{2}+V_{I C 2} \times R_{1}\right)}{300 \times\left(R_{1}+R_{2}\right)+2 \times R_{1} \times R_{2}} \leq V_{C C}-0.8 V \\
V_{\mathrm{IC}_{1}}=\frac{E_{1}^{+}+E_{1}^{-}}{2} \text { and } V_{\mathrm{IC}_{2}}=\frac{E_{2}^{+}+E_{2}^{-}}{2}
\end{gathered}
$$

### 4.9.2 Example 2: one differential input plus one single-ended input

Figure 80. Typical application schematics with one differential input plus one single-ended input

With (Ri in k $\Omega$ ):

$$
\begin{align*}
& \mathrm{A}_{\mathrm{V}_{1}}=\frac{\text { Out }^{+}-\text {Out }^{+}}{\mathrm{E}_{1}^{+}}=\frac{300}{\mathrm{R}_{1}} \\
& \mathrm{~A}_{\mathrm{V}_{2}}=\frac{\text { Out }^{+}-\text {Out }^{-}}{\mathrm{E}_{2}{ }^{+}-\mathrm{E}_{2}^{-}}=\frac{300}{\mathrm{R}_{2}} \\
& \mathrm{C}_{1}=\frac{1}{2 \pi \times \mathrm{R}_{1} \times \mathrm{F}_{\mathrm{CL}}} \tag{F}
\end{align*}
$$

### 4.10 Using the audio amplifier and switch on the same speaker

The TS4961T can be used to supply a speaker with two different sources. The typical application is shown in Figure 81.

Figure 81. Typical application schematics for the TS4961T

The first source is a line-o ut sitjnal provided by the baseband and the second is a speaker-out signal cor, irig irom the CODEC. Switching is done through the standby pin

Note that, as s'רی. in Figure 82, all pins should not be switched at the same time because this cenl a ise damage to the TS4961T audio amplifier and to the external audio amplifier that prc ides the speaker-out signal.

Figure 82. Timing of switching between two audio sources

## 5 Package information

In order to meet environmental requirements, ST offers these devices in ECOPACK ${ }^{\circledR}$ packages. These packages have a lead-free second level interconnect. The category of second level interconnect is marked on the package and on the inner box label, in compliance with JEDEC Standard JESD97. The maximum ratings related to soldering conditions are also marked on the inner box label. ECOPACK is an ST trademark. ECOPACK specifications are available at: www.st.com.

Figure 83. QFN16 $3 \times 3 \mathrm{~mm}$ package mechanical drawing

Note: $\quad$ For enhanced thermal performance the $\epsilon$.oc sed pad must be soldered to a copper area on the PCB, acting as a heatsink. This c Tpper area can be electrically connected to pins 7 and 10 or left floating.
